

Doctro - On Demand Doctor Appointment Booking SaaS

Welcome to Doctro

We are more than happy to assist with any queries you have. this documentation is for basic overview and about how to generate builds using this. Read this document thoroughly if you are experiencing any difficulties.

Admin Panel Setup

Server requirements

let's jump to the basic requirement of the server. any server with Linux installed will work but for better results and good performance, we recommend using a good VPS server with 2 GB or more ram. Having the cPanel is MUST.

PHP Version & Extension Required

- [PHP](#) version 8.1 and Above
- MySQLi PHP extension available

Doctro Installation

Go back to your cPanel home and **click on "File Manager."** It will open in a new tab. Go to the directory you want the script. For your primary domain root directory, you will have to go to "**public_html**" click on **Upload** and **upload the PHP Script into the directory.**

The script you uploaded is likely to be in a **zip file**. To unzip it, simply right click on the zip file and click on **Extract**. The script will be in files or/and folders.

Before start installation process first of all check .env file is exist in your root directory in your uploaded script. If you do not find .env file, you may have to contact [Support](#).

There will be either `server.php` or `index.php`

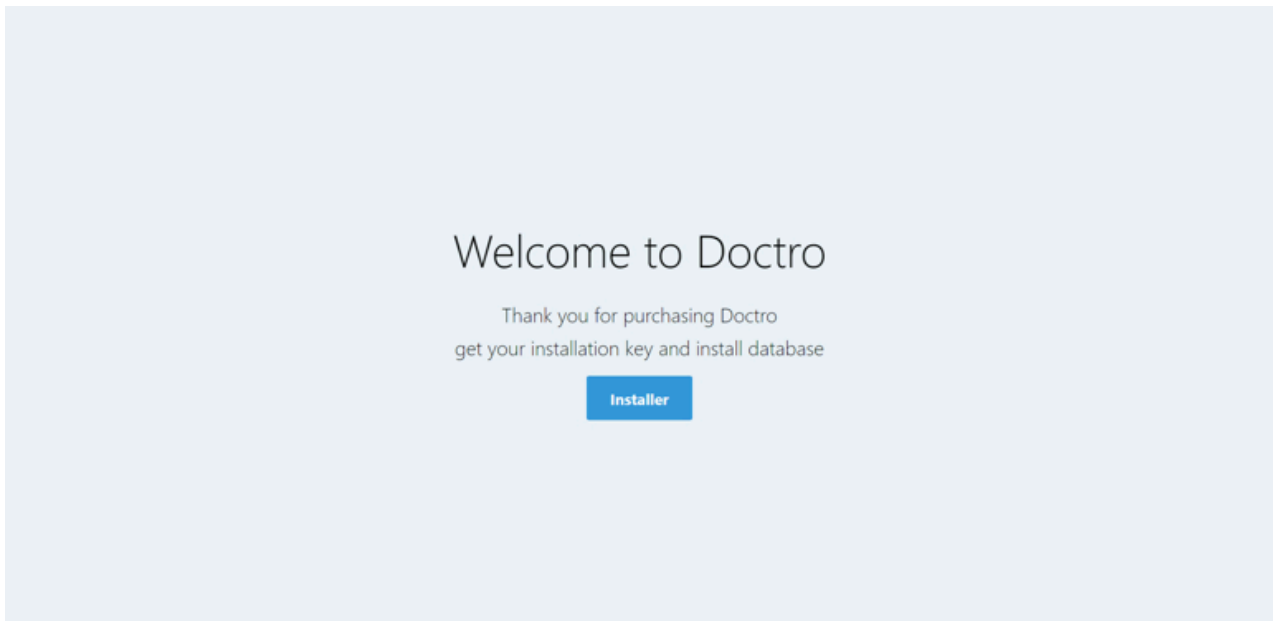

If you are on Local Development Server then the file name should be `server.php` if you are on Live Online Server then file name should be `index.php`

Run Installer

Open your URL: **https://YourURL**

Let's start the installation process

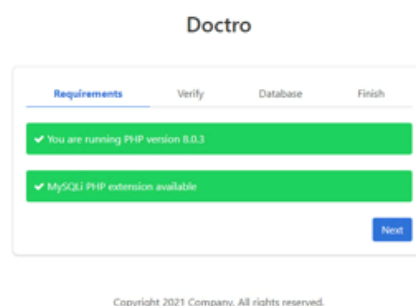

Open your site URL on a web browser connected to the Internet and access your website. In that you get below web page.

Now start The Installation Process

When you click on Doctro installer you follow some easy step for Install database.

Step 1:

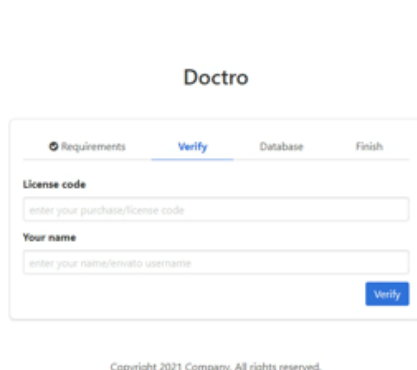

Check your server has valid php version and required extentions.

Step 2:

Once our system finds out that the server requirement is met properly it will proceed to next step which is license validation. there are lots of people selling infected code and to stop that we have implimented license security system. you will have to download license code from your envato account and your envato user name in order to validate the purchase

Requirement :

- Purchase Code
- Envato Username

The screenshot shows a web interface titled "Doctro". At the top, there is a progress bar with four steps: "Requirements", "Verify" (which is the active step), "Database", and "Finish". Below the progress bar, there are two input fields. The first is labeled "License code" and has a placeholder text "enter your purchase/license code". The second is labeled "Your name" and has a placeholder text "enter your name/envato username". To the right of these fields is a blue button labeled "Verify". At the bottom of the interface, there is a small copyright notice: "Copyright 2021 Company, All rights reserved."

Step 3:

Once you have successfully validated your purchase now you have to enter those below details.

- Database Host
- Database username
- Database password
- Database name

Doctro

Requirements Verify **Database** Finish

Database Host

Database Username

Database Password

Database Name

Copyright 2021 Company. All rights reserved.

Step 4:

If you are at step 4 means you almost won the battle, , you just have to show your login admin email id and password which will be later used for logging into the backend panel.

Doctro

Requirements Verify Database **Finish**

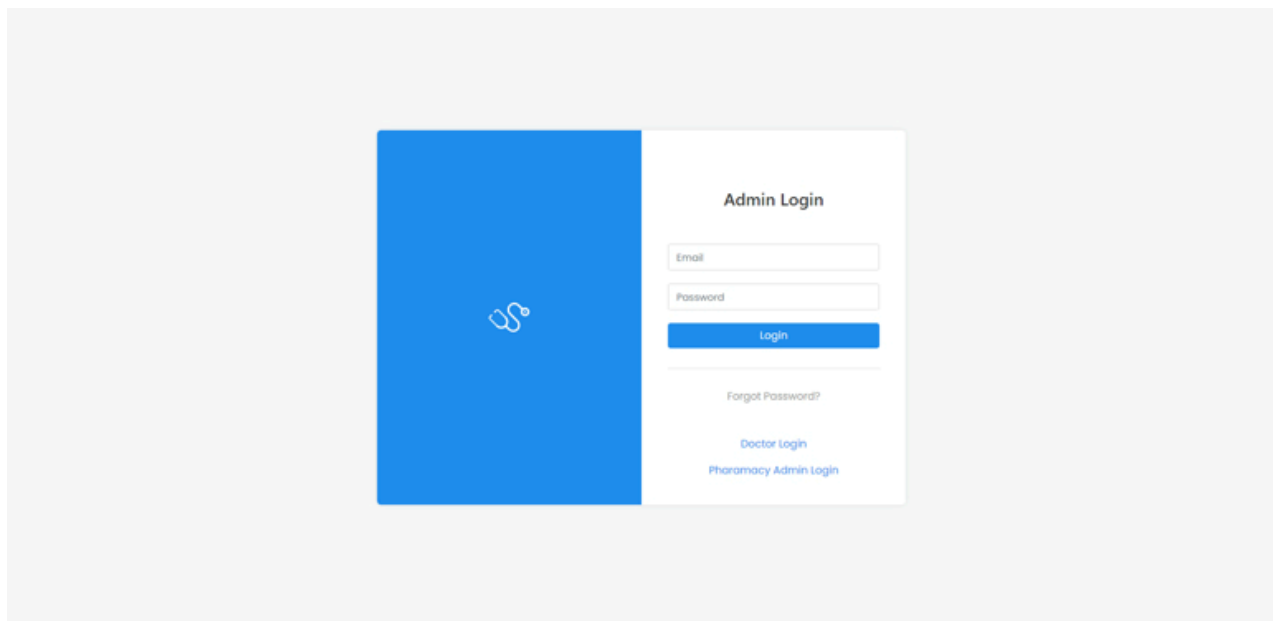

Admin credential

Admin Email

Admin Password

Copyright 2021 Company. All rights reserved.

After complete this step your installation is complete successfully and get your login screen after clicking on proceed to the login button.

Install PHP Script On cPanel

Steps To Install PHP Script On cPanel.

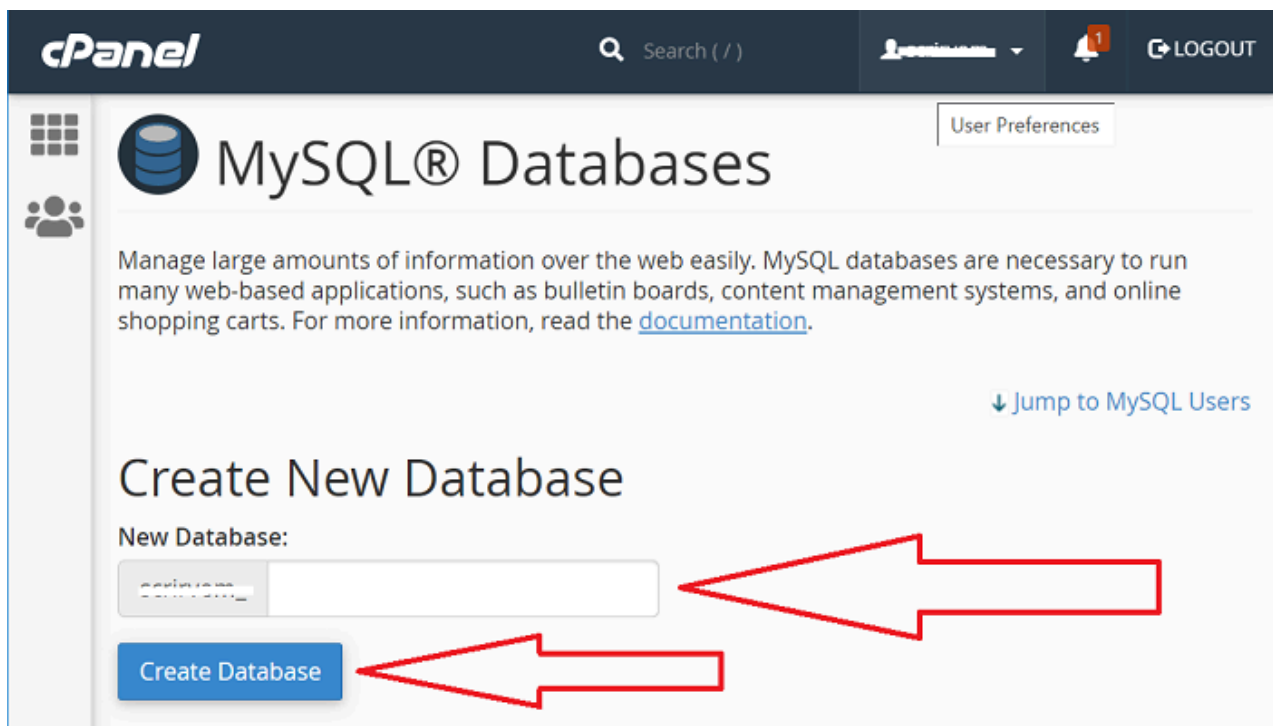

Step 1 :

Login into cPanel with the credentials. If you don't have a cPanel yet, simply purchase a Linux hosting account from any reliable hosting company of your choice. After your purchase, your cPanel login details will be sent to you.

For some hosting companies, you will have to log in from the client's side. That should not be a problem; either way, it's still taking linking to the same cPanel.

Step 2 :

After a successful login, **click on "MySQL Databases"** and create a database. Creating a database is as easy as giving it a name and click on **"Create Database."** The system will automatically create a database with the name you entered.

Step 3:

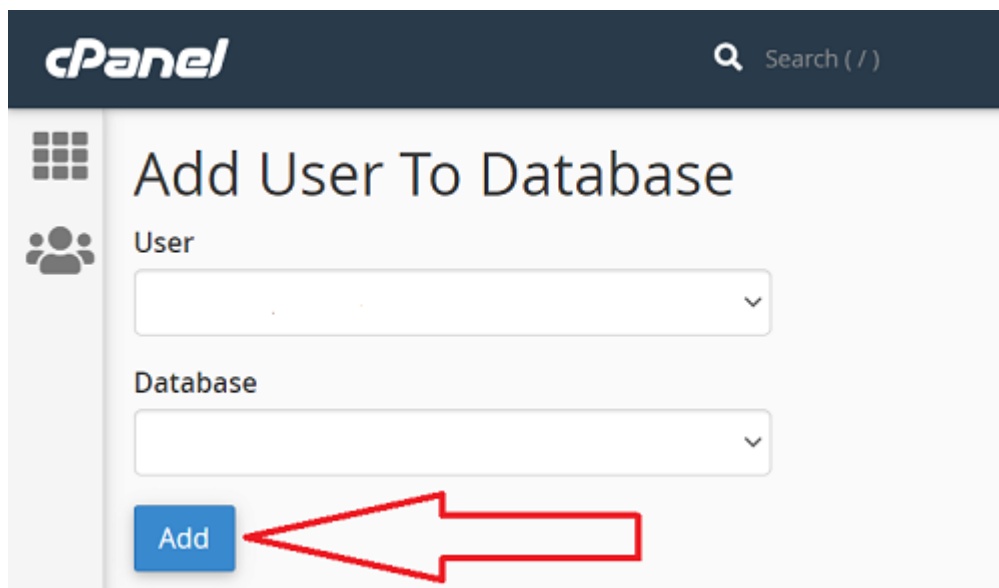

On the same page, you will have to **create a "MySQL Users."** Scroll down the page, **create a user**, and **give it a password**.

The screenshot shows the cPanel interface for adding a new MySQL user. The top navigation bar includes the cPanel logo, a search bar, and a 'LOGOUT' button. The main heading is 'MySQL Users' with a sub-heading 'Add New User'. The form contains the following elements:

- Username:** A text input field with a red error message: 'Username must be alphanumeric characters.'
- Password:** A text input field with a red error message: 'Password cannot be empty.'
- Password (Again):** A text input field with a red error message: 'Passwords must be at least 5 characters long.'
- Strength:** A dropdown menu showing 'Very Weak (0/100)' and a 'Password Generator' button.
- Create User:** A blue button with a red arrow pointing to it.

Step 4:

For your script to be able to work with the database, you will have to **add the user you created to the database**, which was first created. To do this, scroll down on the same page you will see where it's written **"Add User to Database"** with two dropdowns. Simply select the database you created on the first dropdown, and select the created user on the second dropdown and click on **"Add."**

Step 5:

After clicking on "**Add**," it will take you to another where you will have to **check all the checkboxes and click on Make Changes**. This will give the user full access to the database via the script.

cPanel Search

Manage User Privileges

User:
Database:

☒ ALL PRIVILEGES

☒ ALTER	☒ ALTER ROUTINE
☒ CREATE	☒ CREATE ROUTINE
☒ CREATE TEMPORARY TABLES	☒ CREATE VIEW
☒ DELETE	☒ DROP
☒ EVENT	☒ EXECUTE
☒ INDEX	☒ INSERT
☒ LOCK TABLES	☒ REFERENCES
☒ SELECT	☒ SHOW VIEW
☒ TRIGGER	☒ UPDATE

Finally, your database is created. let's jump to the EventRight installation.

Change language

Super Admin is accessed to change language from the General Setting option.

Patient, Laboratory, Doctors, and Pharmacy can change language from their profile only.

Zoom Integration (OAuth 2.0)

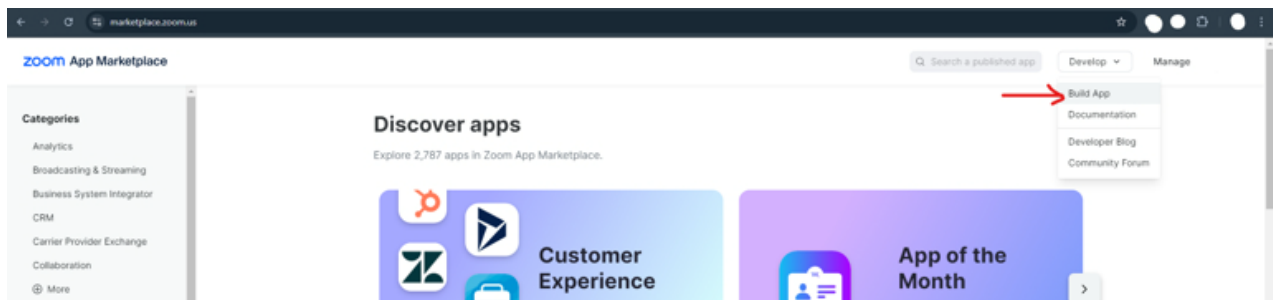

Doctro has Zoom Meeting integration to allow doctors to create meetings on the fly for the existing appointments from the Doctor Panel on the Web.

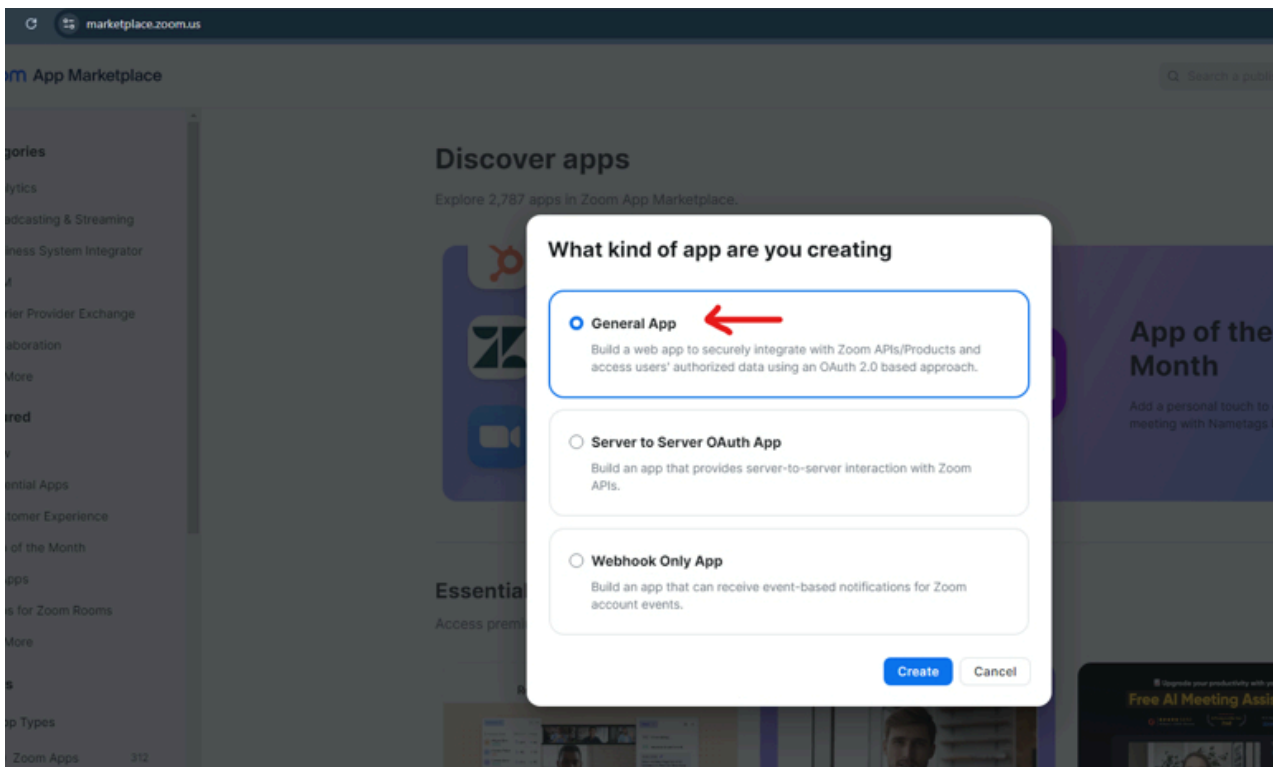

To enable this feature, please sign up to Zoom and acquire Client ID & Client Secret to enter in the Admin Panel. once that is successfully added, doctors will be able to log in to Zoom from the Doctor Panel and add the meeting.

Step 1:

Sign up here: <https://marketplace.zoom.us/>

Step 2: Build App

Step 3:

1. Set a name for your reference
2. Click on Production. You should use Development credentials if just testing it out. then you can switch to production credentials
3. Set User-managed (so that Doctors can use their own Zoom Accounts individually)
4. Copy Both credentials to enter in the Admin Panel.

Select how the app is managed
This may affect Features, Scopes, and permissions to add the app.

☐ Admin-managed
Account admins can add and manage this app. It can access and manage users' data depending on the scope selection.

3 → ☒ **User-managed**
Individual users can add and manage this app. The app only has access to authorized users' data.

App Credentials **Production**

Client ID `_meXaZXdTD2...` Copy ← 4

Client Secret `*****` Regenerate Show Copy ←

Step 4:

Add the Redirection URL as follows:

`https://YOUR-DOMAIN.XYZ/zoom-oauth-callback`

Replace `YOUR-DOMAIN.XYZ` with your live domain name.

App Credentials **Production**

Client ID `_meXaZXdTD2...` Copy

Client Secret `*****` Regenerate Show Copy

OAuth Information **Production**

OAuth Redirect URL
Provide the production redirect URL to generate an authorization URL for production testing.
`e.g. https://yourcompany.com/redirect`

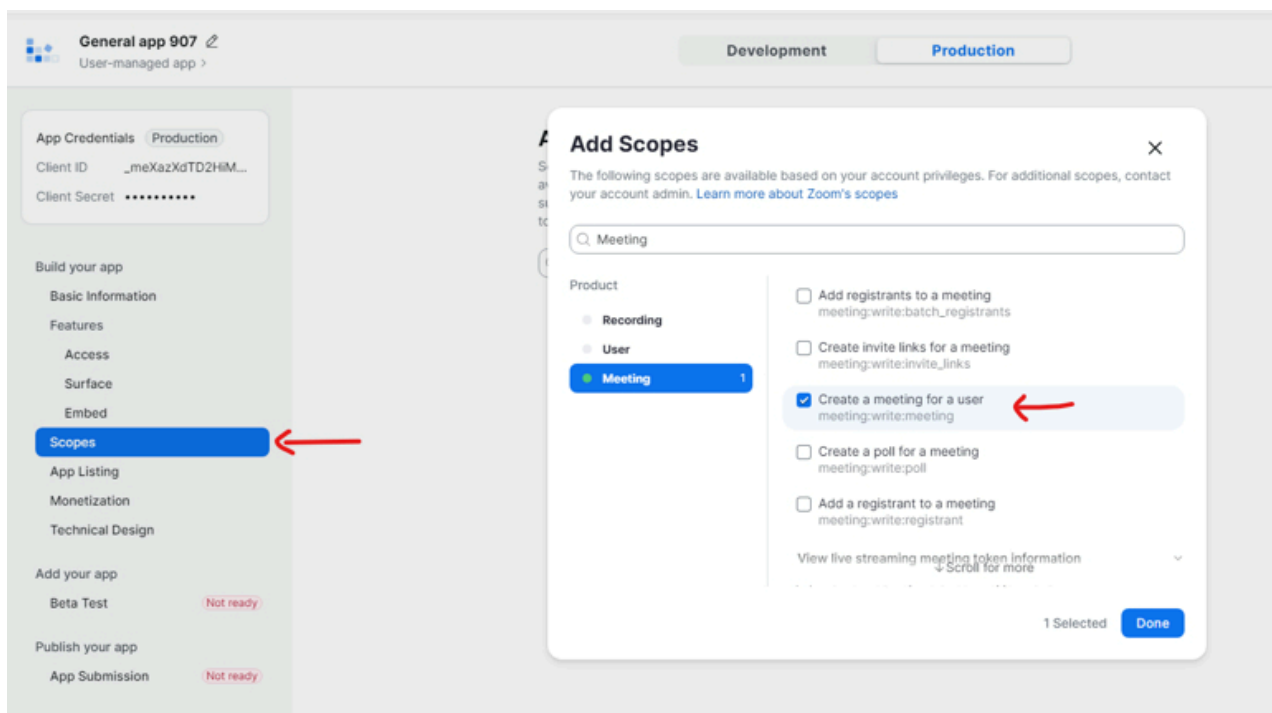

☐ **Use Strict Mode for Redirect URLs**
This option only allows the redirections that exactly match the valid OAuth redirect URLs.

☐ **Subdomain Check**
This is for security check that can prohibit others from tampering with the redirected URLs. This option only allows the redirections that exactly match the subdomain of the valid OAuth redirect URLs.

OAuth Allow Lists
`https://yourcompany.com/allowlist` 🗑️

+ Add Allow List

Step 5: Granting Two Permission Scopes

Add Scopes

The following scopes are available based on your account privileges. For additional scopes, contact your account admin. [Learn more about Zoom's scopes](#)

Q invite

Product

- ☒ Meeting 2
- ☐ Webinar

View and manage your meetings (1)

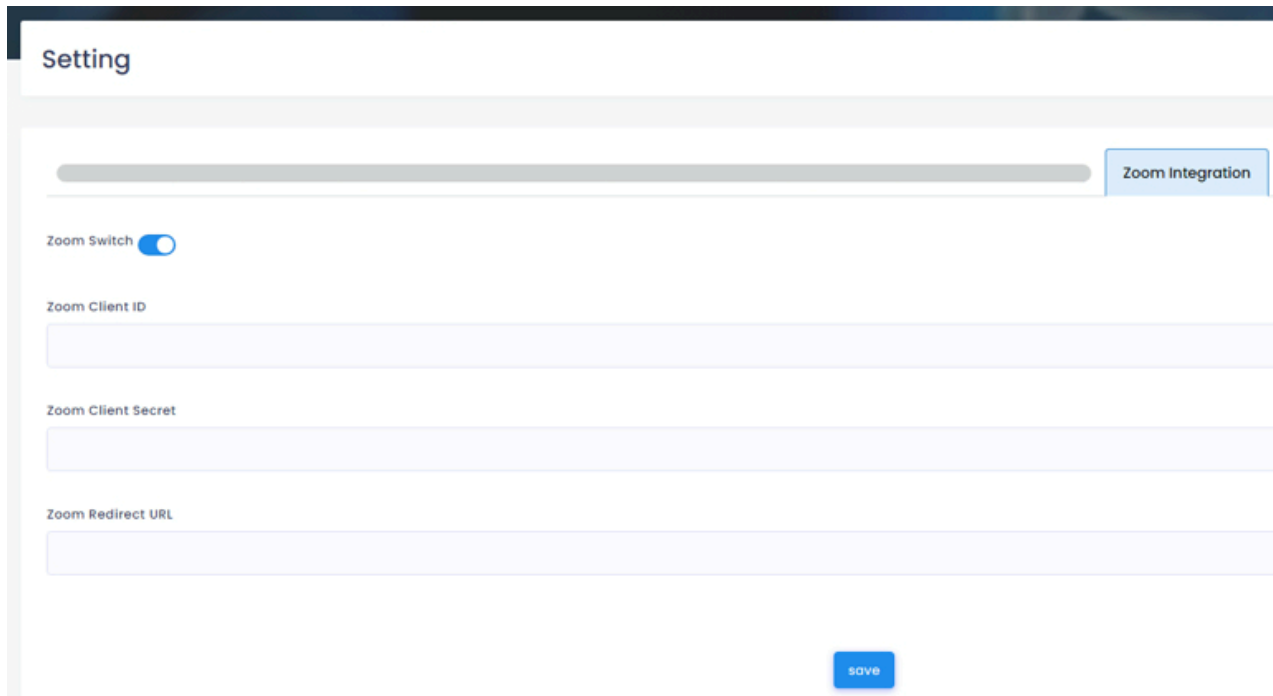

- ☒ Create invite links for a meeting
meeting:write:invite_links

the Add Following paragraph in Scope Description by Copy & Paste:

Our application uses the "meeting:write:meeting" & "meeting:write:invite_links" to create meeting links for medical appointments between Doctors & Patients. The meeting link created by using this scope is stored in plain text in the database.

Step 6:

in the Doctro Admin Panel, add the following data:

The screenshot shows the 'Setting' page in the Doctro Admin Panel. At the top, there is a 'Setting' header. Below it, a progress bar is visible, followed by a 'Zoom Integration' tab. The main content area contains the following fields:

- Zoom Switch:** A toggle switch that is currently turned on (blue).
- Zoom Client ID:** A text input field.
- Zoom Client Secret:** A text input field.
- Zoom Redirect URL:** A text input field.

At the bottom right of the form, there is a blue 'save' button.

Now, the Doctor can create a meeting for the appointment from Doctor Panel > Appointments > Create Meeting. He'll be taken to Zoom Login and then back to the Doctro Meeting Creation Page.

If you have enabled SMTP & Patient Mailing both then you can optionally send meeting link email to the patient if "Send Email to Patient" checkbox is checked.

How to update

Follow the mentioned steps for the update.

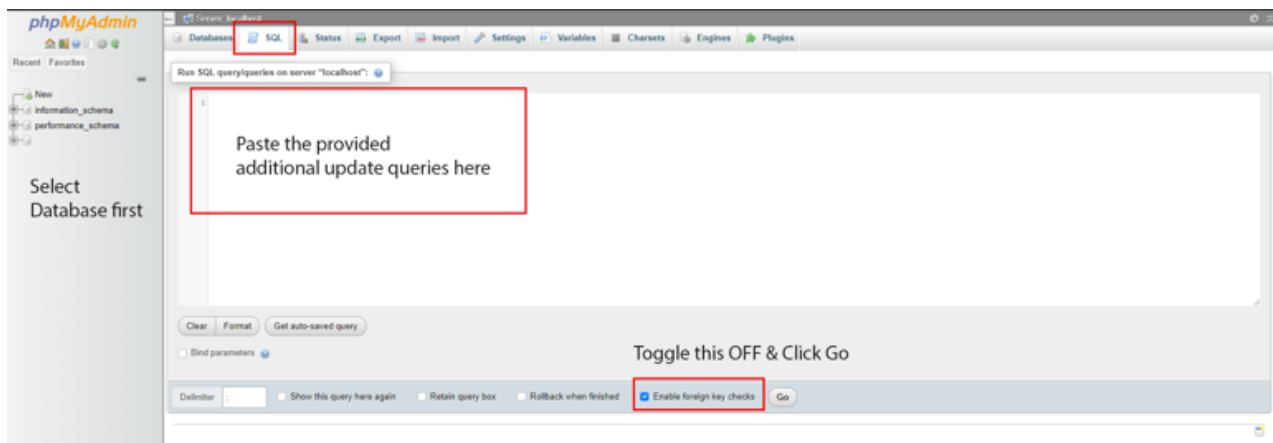

Check the given changed files name list & replace your files with them.
Make sure you know what you are replacing/removing/adding/updating

Once your code comes to same page as ours run the SQL queries if given for the update

TO RUN .SQL FILE or QUERIES (Only if Provided with the Update)

- Go to "phpmyadmin".
- Choose "Import".
- Click on "Choose File" button.
- Upload the "SQL file".
- Click on "Go" button.

If you have individual queries in .txt file, do as per the image below

AFTER IMPORTING SQL FILE

Run your base_url/spatie-cache-clear.

Mobile Apps

We have Patient App & Doctor App as well.
Please check out following link:
